Sprint Review Date: March 26
Scrum Master for Sprint 2: Arda Keskinpala

Sprint 1 Retrospective Connection

From your Sprint 1 Retrospective Change Plan:

Structural issue identified: Some tasks that were sized as Small ended up taking significantly longer than expected due to hidden dependencies. Getting the camera to work reliably on the Android emulator required

Rule or structural change you committed to: Every task must be broken into subtasks with time estimates in hours before work begins. No task may have an estimated total exceeding one class period.

How this rule affects your Sprint 2 planning: We will spend more time as a team breaking our general tasks into smaller chunks that can be achieved in primarily 50-minute chunks, to accommodate class work time.

Sprint 2 Sprint Goal

Write the Sprint Goal exactly as you want to present it during the next Sprint Review.

A good Sprint Goal:

- Describes user value
- Is demonstrable
- Is achievable in this Sprint

Sprint Goal

By the end of Sprint 2, a user will be able to:

Use AI-powered nutrition label scanning and manual data correction (in case the API is missing information or the AI wasn't able to parse everything) and get an AI breakdown of the ingredients, nutrition, and healthiness of the product. We also want to ensure that everything is accessible via a deployed Azure cloud environment.

Backlog Selection

Choose **3–5 backlog items** that directly support your Sprint Goal.

These should come from the **top of the prioritized backlog**.

Priority	Backlog Item	Size (S/M/L)	Reason for Selection
1	Integrate an AI/OCR service to extract text from nutrition label photo	L	Solves missing data issue from the API by reading API directly
2	Create a Manual Entry/Edit option for nutrition fields like calories, carbs, fats, etc.	M	Provides a fallback for users when AI or API fails to read/get data correctly
3	Set up and deploy the application backend/resource group on Azure	M	Makes the project more scalable and decrease latency for requests.
4	Implement AI breakdown of the nutrition facts, ingredients, and overall healthiness of the product. Users can also prompt the AI to expand or explain certain ingredients or macronutrients that they don't understand.	L	Necessary for the core of our app, helps users understand benefits or harms of product.

Task Decomposition

Break backlog items into **small tasks that can be completed in one class period or less**.

Each task must have **one owner**.

Task Owner Related Backlog Item

Call OpenAI API to do basic nutrition breakdown - Siddarth

Create/optimize prompt for OpenAI - Siddarth

Use Nutrition Formatter to make a response that contains the base nutrition facts and the breakdown - Siddarth

Create resource group for our project -Varun

Add python webapp to resource group - Varun

Ensure hosting works properly on school computers - Varun

Implement asynchronous API - Varun

Create UI for manual entry - Leo

Create route to allow for manual entry - Leo

Create function to take manual entries and add them to the OpenAI request - Leo

Make a request to OpenAI image OCR - Arda

Format image analysis response and send to backend - Arda

Definition of Done Confirmation

For work to be considered **Done** in Sprint 2:

- Code runs correctly
- Code is committed and pushed
- Pull Request created
- PR reviewed by another team member
- PR merged into main
- Feature can be demonstrated

Team confirmation

☑ We understand that work cannot be marked Done unless it meets the Definition of Done.

We understand the following definition of done

Demo Planning

What exactly will you demonstrate at the Sprint 2 Review?

Write this as a single sentence.

We will demonstrate communication from our scanner app to the AI in case the barcode database doesn't contain the barcodes.

Our demo will show that a user can:

- Take a picture and get results even if the OpenFoodFacts database does not include the barcode information/data
- Fluent communication with the AI API (with no errors thrown and everything flowing smoothly)
- Getting nutrition facts back using the AI API and sending the barcode to it
- Getting nutrition facts back using the AI API with no barcode, just a nutrition label reader
- A smooth running app with no errors thrown

Risk Assessment

What is the biggest risk to completing your Sprint Goal?

Examples:

- Technical complexity
- Integration challenges
- Time estimation errors

Primary Risk

The primary risk to the sprint goal/demo is the open food facts library not being able to run on school Wi-Fi. Currently the route is blocked by our school network which forces us to use a hotspot while testing.

Mitigation Strategy

To mitigate this, we will try to create and azure resource group to contain our API and future database and hopefully that way, we can make a request to Open Food Facts without using school Wi-Fi and still have the ability to easily test in class.

GitHub Workflow Plan

Confirm the following workflow rules for this Sprint:

☑ All work occurs on feature branches
☑ Pull Requests are reviewed by another team member
☑ PR creators do not merge their own PR
☑ Sprint board reflects real progress

CONFIRMED
